## How Crypto-Assets Are Repairing The Out-Dated Economic Infrastructure

<https://xavierdataresearch.blogspot.com/2023/04/economical-feast.html>

The future is not looking so bright in America; we lack in so many fields when it comes to the economy, and there is no true vision of the future of infrastructure in this country.

This is precisely where Crypto-Assets come into play, considering we immediately started to decline as a country when we cut our ties with gold. Due to greed and those in control, we are disrupting our future of infrastructure just for them to make profits.

Everyone knows these two factors are accurate: those at the top remain at the top because those caught up in their greed give only little to those at the bottom because of their ability to access everything first. The second factor is since the beginning of time, governments tend to always bring their fiat currency to zero.

I wonder what that could be about is the people of the world not paying their taxes? Is it because we spend a lot of money as a country consuming more than what we produce? With everyone pointing the finger at one another, the rich pointing fingers at the poor, and the poor pointing the finger at the rich, no one can see what is going on.

Zoom out and realize the opportunities Blockchain will bring to the table; not only will our digital infrastructure be more robust. Those who have never had the chance of success turn out of the wholes that their governments put them in for the most part.

There are far more things crypto-asset protocols and Blockchain can do for humanity than the fiat currency could ever dream of, but why is it being shunned? It is due to the power these people possess. Please take a look at Cardano and the IOHK team; they made it possible for a place like Ethiopia where only 15% of people who have access to the Internet now have a chance to perform within the educational system. Crypto provides while the current fiat system is getting paid to put people in jail.

Meanwhile, in the United States, we have governments going on live debates and getting paid to argue; while they are doing that day in and day out, our infrastructure base is crumbling down. Recently the American Society of Civil Engineers rated our country with a D for our current infrastructure. It has been 30 years since the federal government has even thought about doing anything about the infrastructure for today's world. Where has the taxpayer's money gone?

Federal Government spending on water dropped from 63% in 1977 to 9% in 2017. Let us not forget the other areas that have taken hit wastewater utilities, inland waters, and of course, our water. This means our current government has no real experience in infrastructure investing; the proof is in the pudding, watching our economy grow slower and slower.

What if we were to invest in the Blockchain that will not go anywhere for a long, long time? Putting it to use pushes the future forward to

grow in size, speed, and strength among the communities. Every day ordinary people and wealthy people no longer will have a gap due to power that those at the bottom can not control sometimes. There are no sides, no control, and justice will be served for putting several million people in a suppressed state for decades.

That's what Blockchain provides, and all the assets that make up the Blockchain also offer for individuals. It won't guarantee millionaires left and right, but one thing is for sure it will not let you have lead in your water because you do not live on the rich side of town or because you are some politician who thinks printing close to almost 8 trillion dollars in a year is the answer. The answer is and always has been science.
